

As the co-founder and coordinator for the Champaign-Urbana Community Wireless Network -- CUWiN -- I know from first-hand experience that these bands need to be utilized by both higher power and low power devices. As the Director for the National Summit for Community Wireless Networking, I heard from over 100 organizations from across the country and they are unified in calling for no additional barriers to be erected, for example, professional installer requirements, that would prevent local organizations from utilizing wireless technologies in support of their community-building work. Reserving the 3650-3700 MHz band solely for high-powered point-to-point links would prevent numerous groups from using this resource, creating a de-facto resource for the sole use of major corporations while preventing the general public from using the public's airwaves.
